

Recitation 8

Problem 8.1. exer Assuming that the eigenvalues of the following problem are positive, determine the eigenvalues of

$$\begin{cases} y''(x) + \lambda y(x) = 0, & x \in (-\pi, \pi) \\ y(-\pi) = y(\pi) = 0. \end{cases} \quad (8.1)$$

Solution. If $\lambda > 0$, then the general solution of the 2nd order linear equation is

$$y(x) = c_1 \cos(\sqrt{\lambda}x) + c_2 \sin(\sqrt{\lambda}x), \quad x \in (-\pi, \pi). \quad (8.2)$$

The boundary conditions then require

$$0 = y(-\pi) = c_1 \cos(\sqrt{\lambda}\pi) - c_2 \sin(\sqrt{\lambda}\pi) \quad (8.3)$$

$$0 = y(\pi) = c_1 \cos(\sqrt{\lambda}\pi) + c_2 \sin(\sqrt{\lambda}\pi). \quad (8.4)$$

We note that this requires

$$\begin{cases} c_1 \cos \sqrt{\lambda}\pi = 0 \\ c_2 \sin \sqrt{\lambda}\pi = 0. \end{cases} \quad (8.5)$$

We note both equations cannot hold simultaneously if $c_1, c_2 \neq 0$. So either $c_1 = 0, c_2 \neq 0$ or $c_1 \neq 0, c_2 = 0$, and we exclude the case $c_1 = c_2 = 0$ since we are interested in non-zero solutions. In the first case, we require

$$\sin \sqrt{\lambda}\pi = 0, \quad (8.6)$$

which implies that $\sqrt{\lambda}$ must be an integer; in the second case, we require

$$\cos \sqrt{\lambda}\pi = 0, \quad (8.7)$$

which implies that $\sqrt{\lambda}$ must be an odd integer multiple of $\frac{1}{2}$. Therefore we may parametrize the positive eigenvalues via

$$\lambda_n = \left(\frac{n}{2}\right)^2 = \frac{n^2}{4}, \quad n = 1, 2, 3, 4, \dots \quad (8.8)$$

□

Problem 8.2. For $a > 0$, find a function x that satisfies

$$\begin{cases} x'(t) = \delta(t - a), & t \geq 0 \\ x(0) = 0. \end{cases} \quad (8.9)$$

Solution. Taking the Laplace transform gives us

$$sX(s) = e^{-as}, \quad (8.10)$$

for appropriate values of s . Then

$$X(s) = \frac{e^{-as}}{s} \quad (8.11)$$

for appropriate values of s . This implies that

$$x(t) = \mathcal{U}(t - a), \quad t \geq 0. \quad (8.12)$$

From this we can also see why the Dirac delta is the “derivative” of the unit step function, but both the differential equation and the relationship between δ and \mathcal{U} has to be understood in the distributional sense, since the step function is not differentiable at the point of discontinuity in the classical sense. \square

Problem 8.3. Find the inverse Laplace transform of $F : (0, \infty) \rightarrow \infty$ defined via

$$F(s) = \frac{s+2}{s^2+4s+5}. \quad (8.13)$$

Solution. We note that we can write

$$F(s) = \frac{s+2}{(s+2)^2+1}, \quad (8.14)$$

therefore

$$f(t) = \mathcal{L}^{-1}\{F\}(t) = e^{-2t} \mathcal{L}^{-1}\left\{\frac{s}{s^2+1}\right\}(t) = e^{-2t} \cos t, \quad t \geq 0 \quad (8.15)$$

□

Problem 8.4. Find the inverse Laplace transform of $F : (0, \infty) \rightarrow \infty$ defined via

$$F(s) = \frac{s+2}{s^2+4s+5}. \quad (8.16)$$

Solution. We note that we can write

$$F(s) = \frac{s+2}{(s+2)^2+1}, \quad (8.17)$$

therefore

$$f(t) = \mathcal{L}^{-1}\{F\}(t) = e^{-2t} \mathcal{L}^{-1}\left\{\frac{s}{s^2+1}\right\}(t) = e^{-2t} \cos t, \quad t \geq 0 \quad (8.18)$$

□

Problem 8.5. Find the Laplace transform of $f : \mathbb{R} \rightarrow \mathbb{R}$ defined via

$$f(t) = \begin{cases} 0, & 0 \leq t < 1 \\ te^t, & t \geq 1 \end{cases} \quad (8.19)$$

Solution. We can write

$$f(t) = te^t \mathcal{U}(t-1). \quad (8.20)$$

Therefore

$$\mathcal{L}\{f\}(s) = e^{-s} \mathcal{L}\{(t+1)e^{t+1}\} = e^{-s+1} (\mathcal{L}\{te^t\} + \mathcal{L}\{e^t\}) = e^{-s+1} \left(\frac{1}{(s-1)^2} + \frac{1}{s-1} \right), \quad s > 1. \quad (8.21)$$

□
